

Regional authorities regulate antibiotic use

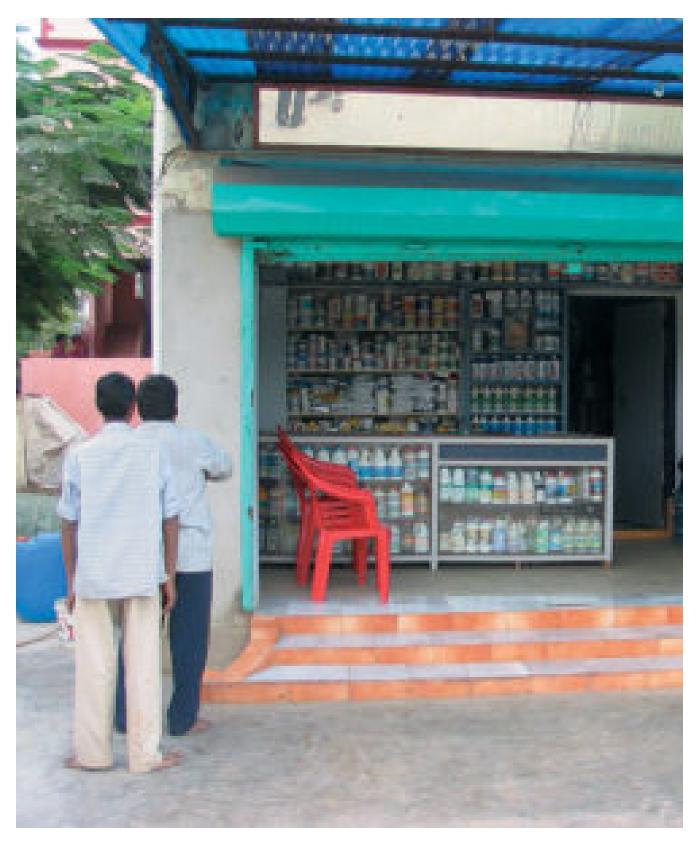

1 June 2004

By Victoria Alday de Graindorge, Ph.D.

Overview of European, U.S. legislative systems

The regulation of antibiotic use has the objectives of guaranteeing the safety and efficacy of the drugs for the animals treated and protecting the health of consumers. As with other drugs, antibiotic use assumes the existence of some potential undesirable effects.

These can include the promotion of resistance to antimicrobial agents, interference with the normal microflora of the treated animals, residues in animal tissues destined for human consumption, potential toxic effects on the cells and tissues of animals, adverse effects due to interactions with other drugs or diseases, and allergic phenomena. Because of such effects, antibiotics are regulated by sanitary authorities.

In some countries, various aquaculture drugs and treatments are available from "shrimp pharmacies."

European union legislation on antibiotics

In the European Union, the entity responsible for the evaluation of medical drugs is the Committee for Medicinal Veterinary Products (CVMP) of the European Agency for the Evaluation of Medicinal Products. Current legislation is based on Regulation no. 2377/90 of the council, dated June 26, 1990, and its later modifications.

Table 1 (right) lists the antibiotics that are authorized by the E.U. for use in aquaculture. Some are specifically authorized for fish species, while most are approved for use in all species destined for human consumption. Also included are prohibited antibiotics whose use is not authorized in any species destined for human consumption.

Table 1. Antibiotics authorized and prohibited by the European Union.

A satilated a	Consider	MDI	Townsh Tipowas			
Antibiotic	Species	MRL	Target Tissues			
Sulfamides	All	100 ug/kg	minopyrimidines Muscle			
Trimethoprim	All	50 ug/kg	Muscle and skin in natural proportions			
	Penicillins					
Amoxicillin	Amoxicillin All 50 ug/kg Muscle, liver, kidney, and fat					
Ampicillin	All	50 ug/kg	Muscle, liver, kidney, and fat			
Benzylpenicillin Cloxacillin	All All	50 ug/kg 300 ug/kg	Muscle, liver, kidney, and fat Muscle, liver, kidney, and fat			
Dicloxacillin	All	300 ug/kg	Muscle, liver, kidney, and fat			
Oxacillin	All	300 ug/kg	Muscle, liver, kidney, and fat			
		Tetracyclines				
Chlortetracycline	All	100 ug/kg 300 ug/kg	Muscle and skin in natural proportions Liver			
		600 ug/kg	Kidney			
Oxytetracycline	All	100 ug/kg	Muscle and skin in natural proportions			
		300 ug/kg	Liver			
Tetracyclines	All	600 ug/kg 100 ug/kg	Kidney Muscle and skin in natural proportions			
letracyclines	Δ"	300 ug/kg	Liver			
		600 ug/kg	Kidney			
		Aminoglud	cosides			
Neomicine	All	500 ug/kg	Muscle and skin in natural proportions,			
		5,000 ug/kg	liver, and fat Kidney			
Paromomicine	All	500 ug/kg	Muscle and skin in natural proportions			
	7	1,500 ug/kg	Liver and kidney			
Espectinomycin	All	300 ug/kg	Muscle and skin in natural proportions			
		500 ug/kg 1,000 ug/kg	Fat Liver			
		5,000 ug/kg	Kidney			
	Chloramphenicol and Derivatives					
Florfenicol	Fishes	1,000 ug/kg	Muscle and skin in natural proportions			
Chloramphenicol	Prohibited					
			s, Streptogramins, and Pleuromutilines			
Erythromycin	All	200 ug/kg	Muscle and skin in natural proportions, liver, kidney, and fat			
Tilmicosin	All	50 ug/kg	Muscle and skin in natural proportions, fat			
		1,000 ug/kg	Liver and kidney			
			Muscle, skin in natural proportions, liver,			
Tylosin	All	100 ug/kg				
			kidney, and fat			
Tylosin Lincomycin	All All	100 ug/kg 50 ug/kg	kidney, and fat Muscle and skin in natural proportions Fat

MRL = Maximum residue limit, All = All species consumed

The CVMP document "Note for Guidance on the Risk Analysis Approach for Residues of Veterinary Medicinal Products in Food of Animal Origin" states that it could be possible to extrapolate the maximum residue limits for salmonids to all fish species.

U.S. use of antibiotics

The United States establishes norms, ensures they are followed and punishes infractions through the Food and Drug Administration (FDA). Through the Center for Veterinary Medicine, FDA is in charge of regulating the studies that pharmaceutical companies must present to obtain approval for drugs to be used in food animals.

This system contemplates the establishment of maximum levels for residues that are innocuous to consum-ers and the necessary requisites to establish the withdrawal period or waiting time between the administration of a drug to animals and its clearance from their systems.

The Food Safety and Inspection Service, under the U.S. Department of Agriculture, has the mission of national control of residue incidence through random sampling of tissues in slaughterhouses and their chemical analysis.

Table 2 lists the antibiotics prohibited by FDA for use in animals destined for human consumption. Table 3 lists the tolerated residue levels established by FDA for aquatic organisms.

Table 2. Antimicrobials prohibited by the U.S. Food and Drug Administration for use in animals destined for human consumption.

destined for human consumption				
Antibiotic				
Chloramphenicol				
Dimetridazole				
Ipronidazole				
Other nitroimidazoles				
Furazolidone				
Nitrofurazone				
Fluoroquinolones				
Glucopeptides				

Table 3. Residues tolerated by the U.S. Food and Drug Administration for aquatic organisms.

Antibiotic Species		Withdrawal Period (days)	Maximum Residue Limit in Flesh (ppm)			
Sulfamerazine	Trout	21	0			
Sulfadimethoxine + Ormetroprim	Salmonids Catfish	42 3	0.1 0.1			
Oxytetracycline	Pacific salmon Salmonids Catfish Lobster	7 21 21 30	2 2 2			

FDA's title 21, chapter I, parts 500-600 code establishes the conditions under which specific antibiotics can be used in species for which they are not registered, with special emphasis on limitations for their applications in animals destined for human consumption.
